

FROG JUMPS:

class Solution:

```
def canCross(self, stones):
    n = len(stones)
    dp = [set() for _ in range(n)]
    dp[0].add(0)
    for i in range(n):
        for jump in dp[i]:
            for k in [jump - 1, jump, jump + 1]:
                if k > 0:
                    pos = stones[i] + k
                    if pos in stones:
                        j = stones.index(pos)
                        dp[j].add(k)
    return len(dp[-1]) > 0
```

2nd question:

```
n, k = map(int, input().split())
h = list(map(int, input().split()))
```

```
dp = [float('inf')] * n
dp[0] = 0
```

```
for i in range(1, n):
    for j in range(1, min(k, i) + 1):
        dp[i] = min(dp[i], dp[i-j] + abs(h[i] - h[i-j]))
```

```
print(dp[n-1])
```
